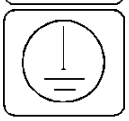
Table of Contents

Important Safety Considerations
Read Carefully

Indicates warning of mains or high voltage present at output labeled HV.
Risk of electrical shock if covers are removed.

Caution – risk of danger. Refer to documentation for detailed explanation of caution symbol wherever marked.



Earth tree symbol: indicates the connection point for the primary earth (ground) supply.

Product complies with appropriate current EU directives (Low Voltage & EMC).

Product complies with appropriate current FCC /UL / CSA 61010-1 directives (Low Voltage & EMC).

Meriden, CT 06450 USA

Notes

1. Introduction

The Canberra Model 9641 High Voltage Power Supply is a single-width NIM family member of the ICB line of programmable front end electronics and has been designed primarily for use with photomultiplier and electron multiplier tubes. By design, the 9641 will accommodate any detector requiring a bias voltage up to 2000 V and a current level of 1 mA or less.

The 9641 allows the user to select from two outputs, one ranging from ±15 to ±2000 V dc and the other derived from the first but attenuated by a factor of 10 giving ±1.5 to ±200 V dc. A 20 segment bar graph displays the output voltage. In addition, this unit allows the user to select the output voltage polarity with an internal control.

The 9641 can withstand any overload or short circuit for an indefinite period of time. The unit can be programmed to either resume normal operations after removal of the fault or to require a programmed reset command.

An INHIBIT input is available for remote shutdown of the 9641. The unit can be programmed to either resume operation upon removal of the INHIBIT signal or to require a programmed reset command.

The 9641 accepts programming information over an 8-bit wide Canberra bus standard called the Instrument Control Bus (ICB). ICB NIMs connect to this bus via a host module such as the Model 556 Acquisition Interface Module (AIM) as part of a hierarchy of networked acquisition and control managed by a Genie family computing platform.

Adjustments are made via the Graphical User Interface of the Genie software environments. Equivalent batch procedure commands are also available in the environments. All ICB NIM parameters are stored in the single data file structure of the Genie family, allowing verification of correct setup from one experiment to the next.

All ICB NIMs feature a characteristic bi-color READY LED to indicate operational status.

2. Controls and Connectors

Front Panel

This is a brief description of the 9641's front panel indicators. For more detailed information, refer to Appendix A, *Specifications.*

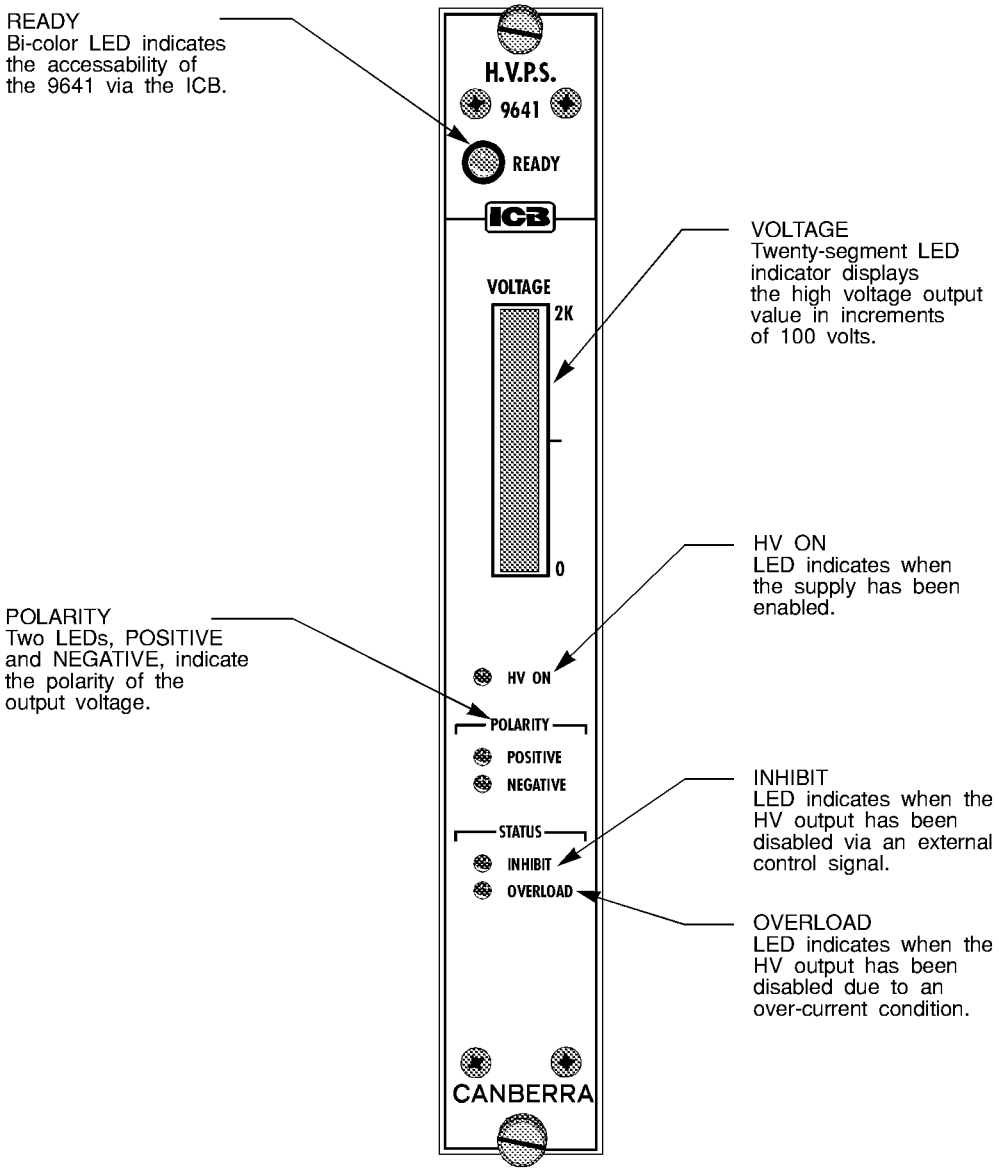

Figure 1 Front Panel Indicators

Rear Panel

This is a brief description of the 9641's rear panel connectors. For more detailed information, refer to Appendix A, *Specifications*.

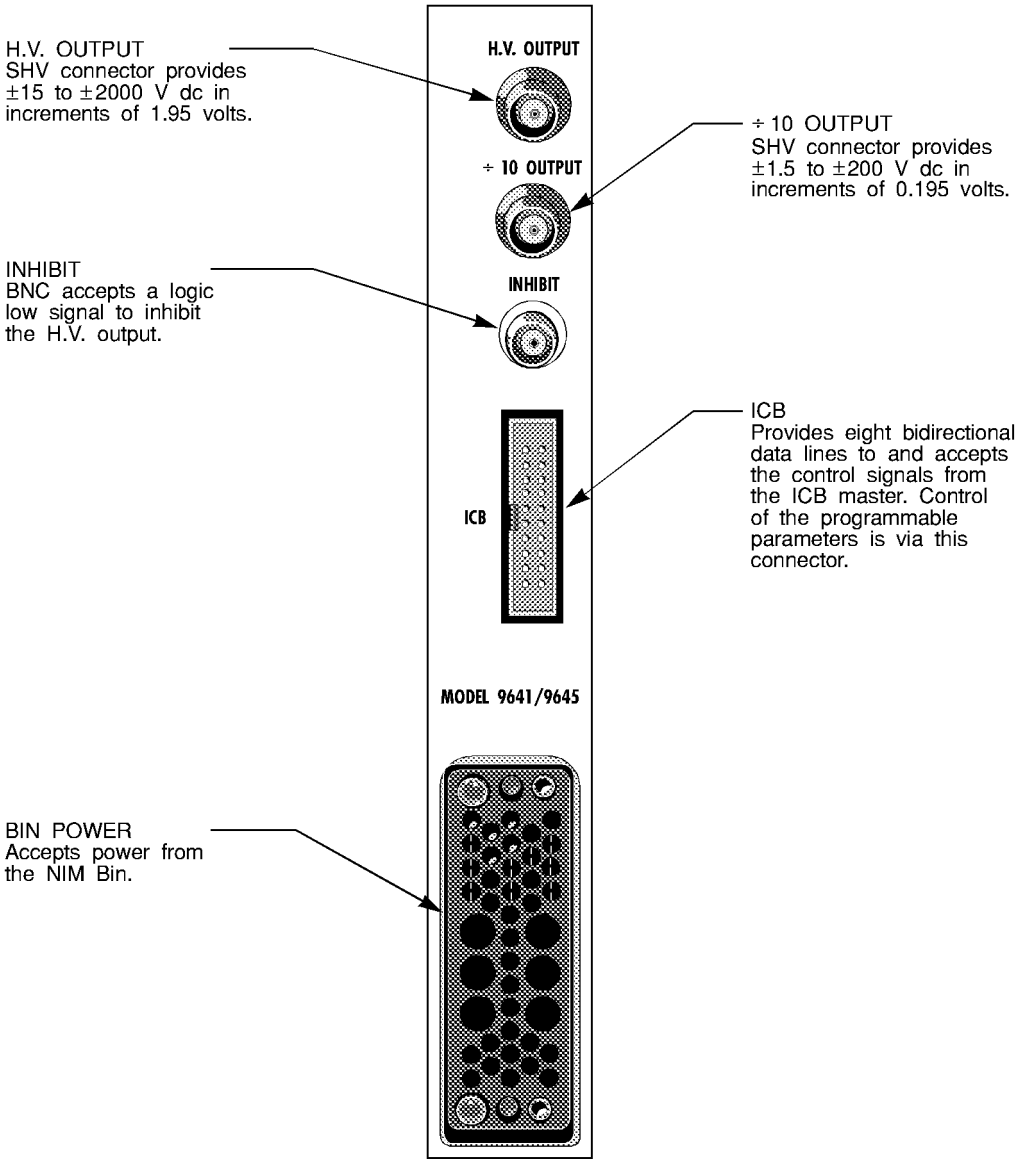

Figure 2 Rear Panel Connectors

Internal Controls

This is a brief description of the internal jumpers. For more detailed information, refer to Appendix A, *Specifications.*

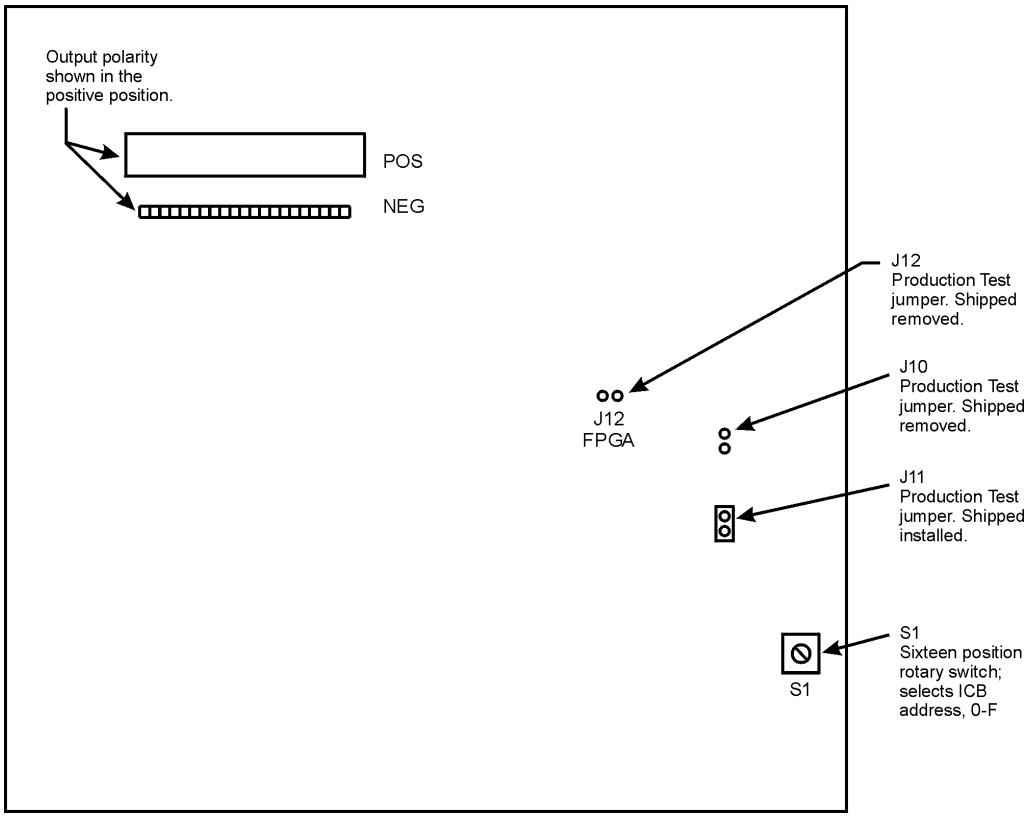

Figure 3 Internal Controls

3. Operation

This chapter discusses the use of the Model 9641's controls and functions. The controls are programmable unless otherwise noted. For proper operation, an ICB master, such as a Model 556 AIM module, and appropriate software, such as Genie-PC, are required. For details on programming the 9641's controls, please refer to the software manual. The Model 9601 AIM/ICB Setup Manual gives complete instructions for setting up an ICB hardware system.

The 9641 is factory set for positive output polarity. If negative polarity is required, change the internal polarity board before installing the unit in the NIM bin (refer to *Polarity Selection* on page 6).

Installation

The Canberra Model 2100 Bin and Power Supply, or other bin and power supply systems conforming to the mechanical and electrical standards set by DOE/ER-00457T will accommodate the Model 9641. The 9641's right side-cover acts as a guide for insertion of the instrument. The module is secured by turning the two front panel captive screws clockwise until finger tight. It is recommended that the NIM bin power switch be OFF whenever the module is installed or removed. To ensure safety, be sure to use a NIM Bin which complies with all applicable safety requirements.

The Model 9641 can be operated where the ambient air temperature is between 0 °C and +50 °C (+120 °F maximum). Perforations in the top and bottom sides permit cooling air to circulate through the module. When relay rack mounted along with other heat generating equipment, adequate clearance should be provided to allow for sufficient air flow through both the perforated top and bottom covers of the NIM bin.

Internal Controls

Before removing the unit from the NIM bin, set the VOLTAGE control to 0.00 volts and the HV to OFF.

WARNING: The Model 9641 generates hazardous high voltage, which may be present for up to one minute after power is removed from the unit.

Avoid the risk of injury. *Do not remove covers* for at least one minute after power has been removed from the unit.

Polarity Selection

Output polarity can be changed by removing the unit's left side cover and changing the polarity selector board's location. The board is symmetrical by design. Polarity is not affected by orientation. When the unit's NIM bin power is turned on, the front panel POLARITY preview LEDs will indicate the current polarity selection. Mirion Technologies (Canberra) recommends that the polarity selection be verified before turning on the unit 's NIM bin power. Factory set to POSitive.

WARNING: *Do not* operate the unit without side covers. Always replace the covers immediately after setting the polarity.

ICB Address Selection

The 9641's ICB address is set using a 16-position PC mounted rotary switch. This switch is accessed through a hole in the left side cover. Using a small screwdriver, set the address to a value of 0-F but unique from other modules connected to the Instrument Control Bus (ICB).

Programmable Controls

A majority of the 9641's controls are programmable. For proper operation, an ICB Master and software (AIM and Genie 2000 for example) are required. Please refer to the software manual for details on controlling the 9641.

Inhibit Control

The Inhibit Function, which is independent of the Voltage Control 's setting, allows the output voltage to be conditionally turned off or latched off by grounding or by applying a logic 0 ($\leq$0.7 V) to the rear panel INHIBIT connector. The front panel INHIBIT STATUS indicator lights when the output has been inhibited.

The programmable INHIBIT input is compatible with all Canberra preamps for either selection in the software setup menu; it isn't necessary to select the signal range to match the HV INHIBIT logic high level of the associated Canberra preamp.

The software selection is provided for compatibility with INHIBIT signals from instruments made by other manufacturers. Selecting 5V sets the pull up/clamp level to +5 volts. Selecting 12V sets the pull up/clamp level to +12 volts. Please consult the manual provided with your instrument for its requirements.

The 9641 can also be programmed for the Latched Inhibit Mode or the Conditional Inhibit Mode.

In the Latched Mode, a reset is required when a logic 1 or open circuit is present at the INHIBIT connector to restore the output voltage. The reset is generated by way of the software platform. In the Conditional Mode, an INHIBIT input of $\geq$2 V or an open circuit enables the output.

Automatic Overload Shutdown

One of the 9641's circuits monitors the output load current and automatically disables the outputs for an overload or a fault condition.

A short duration arc-over or turn-on charging transient will not cause shutdown. The front panel OVERLOAD STATUS indicator lights when the unit has been shut down.

The unit can be programmed to either automatically resume operation when the fault is removed or to require a manual reset by way of the software platform.

High Voltage Output

The High Voltage setting is programmable. It can be controlled to 1 part in 1024: 1.95 V (0.195 on the ÷10 output). Enabling and disabling of the HV output is also programmable. When the HV is enabled, the front panel HV ON indicator will be illuminated.

Setup

After setting the internal controls, install the Model 9641 in the NIM bin. Connect the load to the appropriate rear panel SHV connector, and connect the ICB connector to the ICB Master. Set the NIM bin power to ON; the appropriate polarity LED should light, indicating the polarity selected.

Using the appropriate software, set the HV to ON and the VOLTAGE control to the desired setting. The front panel bar graph will display the HV OUTPUT voltage in kilovolts (kV).

Connectors

The 9641 has four connectors on the rear panel: HV Output and ÷10 Output, Inhibit, and ICB.

HV Output and 10 Output

The 9641 has two rear panel output SHV connectors: HV OUTPUT and ÷10

OUTPUT. Mirion Technologies (Canberra) recommends that only one of these outputs be used at a time.

For detectors operating at relatively low bias voltages and requiring little current, the

÷10 output should be used. This output is provided by means of a simple voltage divider network, which has an impedance of 20 megohms. Therefore, loading effects have to be taken into account if there is a significant current drain.

The advantage of the ÷10 output is that the zero offset and the control are better by a factor of 10 over that of the HV OUTPUT. Most detectors (for example, Canberra PIPS detectors, Si(Li) detectors, and Low Energy (LEGe) detectors), take very little current and are thus compatible with the ÷10 output. The ÷10 output should never be used with scintillation detectors which draw relatively large currents.

Inhibit Connector

This input allows an external control signal to enable/disable the HV output. A logic low will disable the output.

ICB Connector

This connector provides bidirectional data to, and accepts control signals from, the

ICB Master. Control of the 9641 is via this port.

4. Circuit Description

A functional schematic of the Model 9641 can be ordered from Canberra. The high voltage module is basically a dc to dc converter which converts low voltage dc power to a high voltage dc output. This output voltage is highly regulated and filtered, and can be varied by programming the control DAC. The input to the high voltage dc to dc converter is obtained from a conventional NIM power supply and uses ±12 V dc and ±24 V dc. The +5 V for the internal logic is derived from the +6 V NIM Supply.

An oscillator determines a high frequency (≈37 kHz) at which all amplification, high voltage transformation, rectification, and filtering occurs. The amplification is a function of a control voltage which performs the functions of control and regulation. A sample of the output voltage is compared with a reference voltage in the sensing circuit. The sensing circuit generates the control voltage to set and maintain a fixed high voltage output.

A. Specifications

Inputs

INHIBIT – Logic low or ground inhibits the HV outputs; max logic low ≤0.7 V; logic high ≥2.0 V or open circuit enables.

ICB – Provides for connection to the Instrument Control Bus. Control of the Model 9641 is through this interface.

Outputs

HV OUTPUT – ±15 to ±2000 V dc, programmable in 1.95 V increments; 1 mA output current capability; rear panel SHV connector.

÷10 OUTPUT – ±1.5 to ±200 V dc, programmable in 0.195 V increments; output impedance 20 MΩ; rear panel SHV connector.

ICB - Provides feedback on the 9641's status: Inhibit, Overload, Polarity, ON/OFF and HV setting.

Manual Controls

ADDRESS – Rotary switch selects 1 of 16 unique ICB Addresses; accessible through opening in the side cover.

POLARITY – Internal programming plug sets output polarity.

ICB Programmable Controls

ON-OFF – Enable or disable the HV Output.

HV RESET – Restores normal operation following a latched Inhibit and/or Overload Fault condition.

VOLTAGE – Programmable in increments of 1.95 V (0.195 V for the ÷10 output).

MODE CONTROL – Selects latched or non-latched modes for the Inhibit and/or Overload conditions.

Front Panel Indicators

READY – Bi-color LED; green when on-line; yellow for fault or error; off when the module is waiting for the computer to recognize it.

HV OUTPUT – 20 segment Bar graph, 0-2 kV.

POLARITY – Front panel LEDs indicate polarity continuously.

INHIBIT – LED to indicate Inhibit status.

OVERLOAD – LED to indicate Overload status.

Performance

RIPPLE AND NOISE – ≤3 mV peak to peak at 1 mA.

OUTPUT STABILITY – Long term drift of output voltage is ≤0.01%/hr. and ≤0.02%/8 hr. at constant input line voltage, load, and ambient temperature after a 30 minute warmup.

TEMPERATURE COEFFICIENT – ≤±40ppm/°C after 30 minute warmup, operating range 0 to 50 °C.

REGULATION – ≤0.001% variation in output voltage over the load range and ≤0.001% for ±0.1% input voltage change within the operating range at constant ambient temperature.

OVERLOAD PROTECTION – Power supply will withstand any overload, including a short circuit for an indefinite period.

CURRENT LIMIT – 1.3 mA maximum.

RESOLUTION – 1.95 V increments (0.195 V for the ÷10 output).

Connectors

HV OUTPUT – Rear panel SHV

÷10 OUTPUT - Rear panel SHV

INHIBIT – Rear panel BNC

ICB – Rear panel, 20-pin ribbon header.

Power Requirements

+24 V dc – 15 mA +12 V dc – 55 mA

–24 V dc – 10 mA –12 V dc – 50 mA

+6 V dc – 350 mA

Physical

SIZE – Standard single width NIM module 3.43 x 22.12 cm (1.35 x 8.71 in.) per DOE/ER-0457T.

NET WEIGHT – 1.02 kg (2.25 lb)

SHIPPING WEIGHT – 1.93 kg (4.25 lb)

Environmental

OPERATING TEMPERATURE – 0 to 50 °C (32 to 122 °F).

OPERATING HUMIDITY – 0 to 80% relative, non-condensing.

Tested to the environmental conditions specified by EN 61010, Installation Category I, Pollution Degree 2.

Cables

A 12-port connecting cable is supplied with each Model 556 AIM; if the cable is ordered separately, specify Model C1560 12-port ICB Connecting Cable.

B. Rear Panel Connectors

This appendix lists the details of the 9641's rear panel connector.

HV Output

SHV connector supplies 0 to 2000 volts adjustable in increments of 1.95 volts.

10 Output

SHV connector supplies 0 to 200 volts adjustable in increments of 0.195 volts.

Inhibit

BNC connector, input accepts an externally generated signal to enable/disable the HV output. A logic low (≤0.7 volts) will disable the HV Output. The maximum high level is programmable with selections of +5 V or +12 V. A high level or open circuit will enable the HV output.

ICB Interface Connector

This 20-pin ribbon connector (J103) provides all the necessary signals for connection to the Instrument Control Bus (ICB). Negative true signals are shown with a trailing asterisk (LWE*); all other signals are positive true.

PIN	SIGNAL	PIN	SIGNAL
1	GND	2	LD0
3	LD1	4	GND
5	LD2	6	LD3
7	GND	8	LD4
9	LD5	10	GND
11	LD6	12	LD7
13	GND	14	LWE*
15	GND	16	LDS*
17	GND	18	LAS*
19	GND	20	LSRQ*

Interface Signal Functions

This section describes the function of each interface signal in detail. All input and output signals are TTL compatible. Unless otherwise noted, the input signal levels are:

Low = 0 to 1.0 volts
High = 3.0 to 5.0 volts

And the output signal levels are:

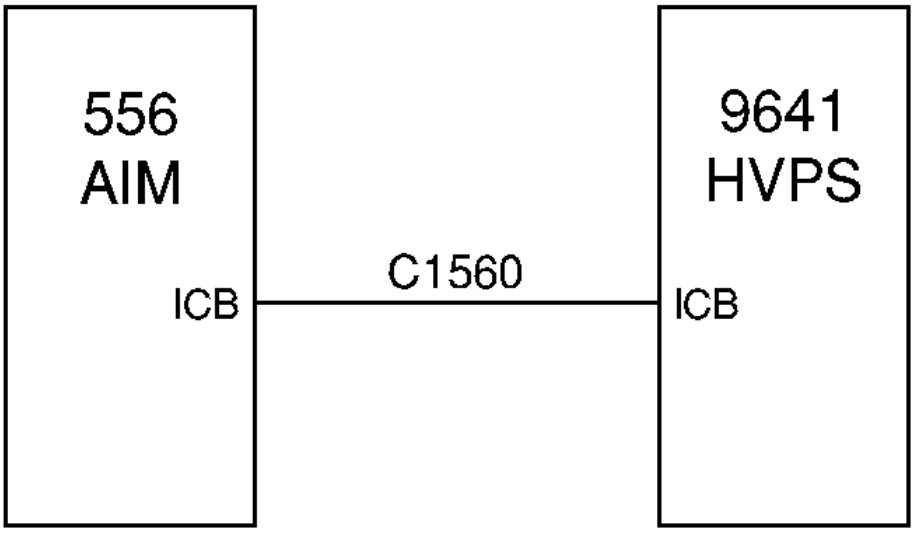
Low = 0 to 0.5 volts
High = 3.0 to 5.0 volts

All input and output signals considered to be a logic 1 for a high voltage level unless the signal name is followed by an asterisk (*), in which case the signal is considered to be a logic 1 for a low voltage level.

SIGNAL	PIN	DESCRIPTION
LD0	2	INPUT/OUTPUT: Address/Data line 0 (LSB).
LD1	3	INPUT/OUTPUT: Address/Data line 1.
LD2	5	INPUT/OUTPUT: Address/Data line 2.
LD3	6	INPUT/OUTPUT: Address/Data line 3.
LD4	8	INPUT/OUTPUT: Address/Data line 4.
LD5	9	INPUT/OUTPUT: Address/Data line 5.
LD6	11	INPUT/OUTPUT: Address/Data line 6.
LD7	12	INPUT/OUTPUT: Address/Data line 7. (MSB)
LWE*	14	INPUT (Write Enable): This signal is active when the ICB master is writing to the ICB.
LDS*	16	INPUT (Data Strobe): Used to latch the data into a slave during a write cycle or gate the data onto the bus during a read cycle.
LAS*	18	INPUT (Address Strobe): Used to latch the address which the ICB master is accessing into the slave unit.
LSRQ*	20	OUTPUT (System Request): This signal is set when the slave requires service from the ICB master.
GND	1, 4, 7, 10, 13, 15, 17, 19	DC common for all interface signals.

C. Setup Diagram

This block diagrams is included to help you set up your system.



Setup Diagram for 9641 Manual

D. Installation Considerations

This unit complies with all applicable requirements. Compliance testing was performed with application configurations commonly used for this device.

During design and assembly of the device, precautions were taken by the manufacturer to minimize the effects of RFI and EMC on the system. However, care should be taken to maintain full compliance. These considerations include:

- A rack or tabletop enclosure fully closed on all sides with rear door access.
- Single point external cable access.
- Blank panels to cover open front panel Bin area.
- Compliant grounding and safety precautions for any internal power distribution.
- The use of NRTL/CE compliant accessories such as fans, UPS, etc.

Preventive Maintenance

This unit does not require any periodic cleaning maintenance.

Any maintenance should be performed by a qualified Mirion Technologies (Canberra) service representative.

Operating Protection Impairment

Mirion Technologies (Canberra) is not liable for any operational malfunctions or personal injuries due to mishandling or unauthorized repair and maintenance not detailed in this manual.

Cleaning/Decontamination

When needed, the unit may be cleaned. Remove power from the unit before cleaning. Use only a soft cloth dampened with warm water and do not allow water to enter the unit. Make sure unit is fully dry before restoring power. Because of excess holes in the NIM wrap, *do not* use any liquids to clean the wrap, side, or rear panels.

E. FCC Notice

The following paragraphs are notices required by Federal Communications Commission (FCC) rules, Part 15, Subpart A.

"The user is cautioned that any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment."

This equipment has been tested and found to comply with the limits for a class A digital Device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Request for Circuit Information

The Schematics and Block Diagrams may be available for this unit directly from Mirion Technologies (Canberra). Request can be made by calling, faxing, or emailing:

Training and Technical Services Department
Mirion Technologies (Canberra), Inc,
800 Research Parkway, Meriden, CT 06450
Telephone: (800) 255-6370FAX: (203) 639-2067
Email: **techsupport@canberra.com**

If you would like schematics, if available, for this unit, please provide us with the following information.

Your Name _____

Your Address _____

_____

_____

_____

_____

Unit's model number _____

Unit's serial number _____

Note: Schematics and block diagrams are provided for information only; if you service or repair or try to service or repair this unit without Mirion Technologies (Canberra)'s written permission you may void your warranty.

Warranty

Mirion Technologies (Canberra) Inc. (we, us, our) warrants to the customer (you, your) that for a period of ninety (90) days from the date of shipment, software provided by us in connection with equipment manufactured by us shall operate in accordance with applicable specifications when used with equipment manufactured by us and that the media on which the software is provided shall be free from defects. We also warrant that (A) equipment manufactured by us shall be free from defects in materials and workmanship for a period of one (1) year from the date of shipment of such equipment, and (B) services performed by us in connection with such equipment, such as site supervision and installation services relating to the equipment, shall be free from defects for a period of one (1) year from the date of performance of such services.

If defects in materials or workmanship are discovered within the applicable warranty period as set forth above, we shall, at our option and cost (A) in the case of defective software or equipment, either repair on a return to factory basis or replace the software or equipment, or (B) in the case of defective services, reperform such services.

LIMITATIONS

EXCEPT AS SET FORTH HEREIN, NO OTHER WARRANTIES OR REMEDIES, WHETHER STATUTORY, WRITTEN, ORAL, EXPRESSED, IMPLIED (INCLUDING WITHOUT LIMITATION, THE WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) OR OTHERWISE, SHALL APPLY. IN NO EVENT SHALL WE HAVE ANY LIABILITY FOR ANY SPECIAL, EXEMPLARY, PUNITIVE, INDIRECT OR CONSEQUENTIAL LOSSES OR DAMAGES OF ANY NATURE WHATSOEVER, WHETHER AS A RESULT OF BREACH OF CONTRACT, TORT LIABILITY (INCLUDING NEGLIGENCE), STRICT LIABILITY OR OTHERWISE. REPAIR OR REPLACEMENT OF THE SOFTWARE OR EQUIPMENT DURING THE APPLICABLE WARRANTY PERIOD AT OUR COST, OR, IN THE CASE OF DEFECTIVE SERVICES, REPERFORMANCE AT OUR COST, IS YOUR SOLE AND EXCLUSIVE REMEDY UNDER THIS WARRANTY.

EXCLUSIONS

Our warranty does not cover damage to equipment which has been altered or modified without our written permission or damage which has been caused by abuse, misuse, accident, neglect or unusual physical or electrical stress, as determined by our Service Personnel.

We are under no obligation to provide warranty service if adjustment or repair is required because of damage caused by other than ordinary use or if the equipment is serviced or repaired, or if an attempt is made to service or repair the equipment, by other than our Service Personnel without our prior approval.

Our warranty does not cover detector damage due to neutrons or heavy charged particles. Failure of beryllium, carbon composite, or polymer windows or of windowless detectors caused by physical or chemical damage from the environment is not covered by warranty.

We are not responsible for damage sustained in transit. You should examine shipments upon receipt for evidence of damage caused in transit. If damage is found, notify us and the carrier immediately. Keep all packages, materials and documents, including the freight bill, invoice and packing list.

Revised 04 Nov 16

CANBERRA

Features

- Complete programmability within the Genie™ family
- Utilizes the CANBERRA Instrument Control Bus (ICB)
- Regulated up to ±2000 V dc, 1 mA output
- Noise and ripple <3 mV peak to peak
- Overload and short circuit protected
- Overload, inhibit and polarity status indicators
- Inhibit and overload latching circuits
- Ramped high voltage output with bar graph indication
- Secure computer operation without conflicting front panel controls

Model 9641 ICB Programmable H.V. Power Supply

Description

The CANBERRA Model 9641 High Voltage Power Supply is a single-width NIM family member of the Instrument Control Bus (ICB) line of programmable front end electronics. It has been designed primarily for use with photomultiplier and electron multiplier tubes. The Model 9641 accepts programming information over the 8-bit wide CANBERRA bus standard called the ICB. By design, the Model 9641 will accommodate any detector requiring a bias voltage up to 2000 V and a current level of 1 mA or less.

The Model 9641 allows the user to select from two outputs, one ranging from ±15 to ±2000 V dc and the other derived from the first but attenuated by a factor of 10 giving ±1.5 to ±200 V dc. A 20-segment bar graph displays the output voltage. In addition, this unit allows the user to select the output voltage polarity with an internal control.

The Model 9641 can withstand any overload or short circuit for an indefinite period of time. The unit can be programmed to either resume normal operations after removal of the fault or to require a programmed reset command.

An INHIBIT input is available for remote shutdown of the Model 9641. The unit can be programmed to either resume operation upon removal of the INHIBIT signal or to require a programmed reset command.

ICB NIMs connect to this bus via a host module such as the Model 556A Acquisition Interface Module (AIM) as part of a hierarchy of networked acquisition and control managed by a Genie family computing platform.

Most adjustments are made through the graphical user interface of the Genie software environments. Equivalent batch procedure commands are also available in the environments. All ICB NIM parameters are stored in the single data file structure of the Genie family, allowing verification of correct set up from one experiment to the next.

All ICB NIMs feature a characteristic READY LED to indicate operational status.

Specifications

INPUTS

- INHIBIT – Logic low or ground inhibits the HV outputs; max logic low ≤0.7 V; logic high ≥2.0 V or open circuit enables.
- ICB – Provides for connection to the Instrument Control Bus. Control of the Model 9641 by Genie software is through this interface.

Model 9641 ICB Programmable H.V. Power Supply

OUTPUTS

- HV OUTPUT – ±15 to ±2000 V dc, programmable in 1.95 V increments; 1 mA output current capability; rear panel SHV connector.
- ÷10 OUTPUT – ±1.5 to ±200 V dc, programmable in 0.195 V increments; output impedance 20 MΩ; rear panel SHV connector.
- ICB – Provides feedback on the Model 9641's status: Inhibit, Overload, Polarity, ON/OFF and HV setting.

MANUAL CONTROLS

- ADDRESS – Rotary switch selects 1 of 16 unique ICB Addresses; accessible through opening in the side cover.
- POLARITY – Internal programming plug sets output polarity.

ICB PROGRAMMABLE CONTROLS

- ON-OFF – Enable or disable the HV Output.
- HV RESET – Restores normal operation following a latched Inhibit and/or Overload Fault condition.
- VOLTAGE – Programmable in increments of 1.95 V (0.195 V for the ÷10 output).
- MODE CONTROL – Selects latched or non-latched modes for the Inhibit and/or Overload conditions.

FRONT PANEL INDICATORS

- READY – Bi-color LED; green when on-line; yellow for fault or error; off when the module is waiting for the computer to recognize it.
- HV OUTPUT – 20-segment Bar graph, 0-2 kV.
- POLARITY – Front panel LEDs indicate polarity continuously.
- INHIBIT – LED to indicate Inhibit status.
- OVERLOAD – LED to indicate Overload status.

PERFORMANCE

- RIPPLE AND NOISE – ≤3 mV peak to peak at 1 mA.
- OUTPUT STABILITY – Long term drift of output voltage is ≤0.01%/hr. and ≤0.02%/8 hr. at constant input line voltage, load, and ambient temperature after a 30 minute warmup.
- TEMPERATURE COEFFICIENT – ≤±40 ppm/°C after 30 minute warmup, operating range 0 to 50 °C.
- REGULATION – ≤0.001% variation in output voltage over the load range and ≤0.001% for ±0.1% input voltage change within the operating range at constant ambient temperature.
- OVERLOAD PROTECTION – Power supply will withstand and recover from overload, including a short circuit for an indefinite period.
- CURRENT LIMIT – 1.3 mA maximum.
- RESOLUTION – 1.95 V increments (0.195 V for the ÷10 output).

CONNECTORS

- HV OUTPUT – Rear panel SHV.
- ÷10 OUTPUT – Rear panel SHV.
- INHIBIT – Rear panel BNC.
- ICB – Rear panel, 20-pin ribbon.

- Overload and short circuit protected
- Overload, inhibit and polarity status indicators
- Inhibit and overload latching circuits
- Ramped high voltage output with bar graph indication
- Secure computer operation without conflicting front panel controls

Description

The CANBERRA Model 9641 High Voltage Power Supply is a single-width NIM family member of the Instrument Control Bus (ICB) line of programmable front end electronics. It has been designed primarily for use with photomultiplier and electron multiplier tubes. The Model 9641 accepts programming information over the 8-bit wide CANBERRA bus standard called the ICB. By design, the Model 9641 will accommodate any detector requiring a bias voltage up to 2000 V and a current level of 1 mA or less.

The Model 9641 allows the user to select from two outputs, one ranging from ±15 to ±2000 V dc and the other derived from the first but attenuated by a factor of 10 giving ±1.5 to ±200 V dc. A 20-segment bar graph displays the output voltage. In addition, this unit allows the user to select the output voltage polarity with an internal control.

The Model 9641 can withstand any overload or short circuit for an indefinite period of time. The unit can be programmed to either resume normal operations after removal of the fault or to require a programmed reset command.

An INHIBIT input is available for remote shutdown of the Model 9641. The unit can be programmed to either resume operation upon removal of the INHIBIT signal or to require a programmed reset command.

ICB NIMs connect to this bus via a host module such as the Model 556B Acquisition Interface Module (AIM) as part of a hierarchy of networked acquisition and control managed by a Genie family computing platform.

Most adjustments are made through the graphical user interface of the Genie software environments. Equivalent batch procedure commands are also available in the environments. All ICB NIM parameters are stored in the single data file structure of the Genie family, allowing verification of correct set up from one experiment to the next.

All ICB NIMs feature a characteristic READY LED to indicate operational status.

Specifications

INPUTS

- INHIBIT – Logic low or ground inhibits the HV outputs; max logic low ≤0.7 V; logic high ≥2.0 V or open circuit enables.
- ICB – Provides for connection to the Instrument Control Bus. Control of the Model 9641 by Genie software is through this interface.

Model 9641 ICB Programmable H.V. Power Supply

OUTPUTS

- HV OUTPUT – ±15 to ±2000 V dc, programmable in 1.95 V increments; 1 mA output current capability; rear panel SHV connector.
- ÷10 OUTPUT – ±1.5 to ±200 V dc, programmable in 0.195 V increments; output impedance 20 MΩ; rear panel SHV connector.
- ICB – Provides feedback on the Model 9641's status: Inhibit, Overload, Polarity, ON/OFF and HV setting.

MANUAL CONTROLS

- ADDRESS – Rotary switch selects 1 of 16 unique ICB Addresses; accessible through opening in the side cover.
- POLARITY – Internal programming plug sets output polarity.

ICB PROGRAMMABLE CONTROLS

- ON-OFF – Enable or disable the HV Output.
- HV RESET – Restores normal operation following a latched Inhibit and/or Overload Fault condition.
- VOLTAGE – Programmable in increments of 1.95 V (0.195 V for the ÷10 output).
- MODE CONTROL – Selects latched or non-latched modes for the Inhibit and/or Overload conditions.

FRONT PANEL INDICATORS

- READY – Bi-color LED; green when on-line; yellow for fault or error; off when the module is waiting for the computer to recognize it.
- HV OUTPUT – 20-segment Bar graph, 0-2 kV.
- POLARITY – Front panel LEDs indicate polarity continuously.
- INHIBIT – LED to indicate Inhibit status.
- OVERLOAD – LED to indicate Overload status.

PERFORMANCE

- RIPPLE AND NOISE – ≤3 mV peak to peak at 1 mA.
- OUTPUT STABILITY – Long term drift of output voltage is ≤0.01%/hr. and ≤0.02%/8 hr. at constant input line voltage, load, and ambient temperature after a 30 minute warmup.
- TEMPERATURE COEFFICIENT – ≤±40 ppm/°C after 30 minute warmup, operating range 0 to 50 °C.
- REGULATION – ≤0.001% variation in output voltage over the load range and ≤0.001% for ±0.1% input voltage change within the operating range at constant ambient temperature.
- OVERLOAD PROTECTION – Power supply will withstand and recover from overload, including a short circuit for an indefinite period.
- CURRENT LIMIT – 1.3 mA maximum.
- RESOLUTION – 1.95 V increments (0.195 V for the ÷10 output).

CONNECTORS

- HV OUTPUT – Rear panel SHV.
- ÷10 OUTPUT – Rear panel SHV.
- INHIBIT – Rear panel BNC.
- ICB – Rear panel, 20-pin ribbon.

ICB PROGRAMMING SUMMARY

Setup Parameters	Read	Write
Output Voltage	X	X
Voltage Polarity	X	
Inhibit Logic Levels	X	X
Latch Inhibit Mode	X	X
Latch Overload Mode	X	X
Module Status		
ICB Address	X	
Model Number	X	
Factory Serial Number	X	
Hardware Fault	X	
Inhibit Condition	X	
Overload Condition	X	
Control		
On-Line	X	X
Off-Line	X	X
Problem	X	X
Inhibit/Overload Reset		X

POWER REQUIREMENTS

+24 V dc – 15 mA +12 V dc – 55 mA
–24 V dc – 10 mA –12 V dc – 50 mA
+6 V dc – 350 mA

PHYSICAL

- SIZE – Standard single width NIM module 3.43 x 22.12 cm (1.35 x 8.71 in.) per DOE/ER-0457T.
- NET WEIGHT – 1.02 kg (2.25 lb).
- SHIPPING WEIGHT – 1.93 kg (4.25 lb).

ENVIRONMENTAL

- OPERATING TEMPERATURE – 0 to 50 °C.
- OPERATING HUMIDITY – 0 to 80% relative, non-condensing.
- Meets the environmental conditions specified by EN 61010, Installation Category I, Pollution Degree 2.

CABLES

- A 12-port connecting cable is supplied with each Model 556A AIM; if the cable is ordered separately, specify Model C1560 12-port ICB Connecting Cable.
